

Tips to improve the quality of your scientific review/report (2)

Dear future colleagues,

We are now accepting final reports/reviews. Some of you may have gotten a letter indicating that their final report has been accepted. Others got a response suggesting they prepare a check list and attach it to their report. If you part of the latter group, it means that there is something that needs to be improved in your report. For example, some of you fail to cite properly the reference from which they got the information. One example of that is to just list the references at the end of the review without any mention of them in the text.

I do hope you try to make use of my recommendations; they are not obligatory, but they sure help.

I wish you all the best. Stay Safe.
