Order of Authors: Ayman El-Garf; Marwa Abdo, M.D.; Alkhateeb Alkemy; Sally Mohamed

Abstract: Aim of the work: To study patterns and disease subsets of Behcet's disease (BD) patients admitted to Cairo University Hospitals and to detect whether relapse of the disease will affect the same system every time or not. Patients and methods: A retrospective study involving 82 BD patients admitted to Cairo University Hospitals, from January 2000 to December 2014. They were reviewed to analyze the frequency of different disease manifestations and to find out disease patterns and subsets. Results: 75 men and 7 women were included in the study, with a mean age of  $34.2 \pm 9.7$  years. Their disease duration ranged from 1 to 34 years with a mean of  $9.1 \pm 6.9$  years. Mucocutaneous manifestations were present in 82 patients (100%), ocular manifestations in 53 patients (64.4%), vascular manifestations in 49 patients (59.8%), and neurological manifestations in 9 patients (11%). Most of our patients, 48 (58.5%) had the same one system pattern throughout the disease course, 25 patients (30.5%) had two systems patterns and 9 patients (11%) had three systems patterns. Conclusion: BD usually affects the same system throughout the disease course whether mucocutaneous, vascular, ocular or neurological and the most common pattern is the one system affection. This will help to predict the system that will be affected in each time the patient presents with a disease relapse. Also, it will help in differentiation between disease relapse and any associated other disease minimizing the need for and the cost of investigations. However, future studies on larger number of patients are recommended.

## CONFLICT OF INTEREST DECLARATION AND AUTHOR AGREEMENT FORM

It is important that you return this form upon submission. We will not publish your article without completion and return of this form.

Title of Paper: Behçet's disease patterns and subsets in a cohort of Egyptian patients

Please tick one of the following boxes:

- We have no conflict of interest to declare.
- We have a competing interest to declare (please fill in box below):

This statement is to certify that all Authors have seen and approved the manuscript being submitted. We warrant that the article is the Authors' original work. We warrant that the article has not received prior publication and is not under consideration for publication elsewhere. On behalf of all Co-Authors, the corresponding Author shall bear full responsibility for the submission.

This research has not been submitted for publication nor has it been published in whole or in part elsewhere. We attest to the fact that all Authors listed on the title page have contributed significantly to the work, have read the manuscript, attest to the validity and legitimacy of the data and its interpretation, and agree to its submission to *The Egyptian Rheumatologist* (EJR).

All authors agree that author list is correct in its content and order and that no modification to the author list can be made without the written acceptance of all authors and the formal approval of the Editor-in-Chief. All authors accept that the Editor-in-Chief's decisions over acceptance or rejection or in the event of any breach of the Principles of Ethical Publishing in *The Egyptian Rheumatologist* (EJR) being discovered, of retraction are final.

Upon acceptance, the Author assigns to *The Egyptian Rheumatologist* (EJR) the right to publish and distribute the manuscript in part or in its entirety. The Author's name will always be included with the publication of the manuscript.

The Author has the following nonexclusive rights: (1) to use the manuscript in the Author's teaching activities; (2) to publish the manuscript, or permit its publication, as part of any book the Author may write; (3) to include the manuscript in the Author's own personal or departmental (but not institutional) database or on-line site; and (4) to license reprints of the manuscript to third persons for educational photocopying. The Author also agrees to properly credit *The Egyptian Rheumatologist* (EJR) as the original place of publication.

The Author hereby grants *The Egyptian Rheumatologist* (EJR) full and exclusive rights to the manuscript, all revisions, and the full copyright. *The Egyptian Rheumatologist* (EJR) rights include but are not limited to the following: (1) to reproduce, publish, sell, and distribute copies of the manuscript, selections of the manuscript, and translations and other derivative works based upon the manuscript, in print, audio-visual, electronic, or by any and all media now or hereafter known or devised; (2) to license reprints of the manuscript to third persons for educational photocopying; (3) to license others to create abstracts of the manuscript and to index the manuscript; (4) to license secondary publishers to reproduce the manuscript in print, microform, or any computer-readable form, including electronic on-line databases; and (5) to license the manuscript for document delivery. These exclusive rights run the full term of the copyright, and all renewals and extensions thereof.

- Please check this box if you are submitting this on behalf of all authors.

Dear Sir,

I am pleased to submit an original research article entitled "**Behçet's disease patterns and subsets in a cohort of Egyptian patients**" for consideration for publication in The Egyptian Rheumatologist Journal. We aimed to study patterns and disease subsets of Behcet's disease (BD) patients admitted to Cairo University Hospitals and to detect whether relapse of the disease will affect the same system every time or not. The study showed that BD usually affects the same system throughout the disease course whether mucocutaneous, vascular, ocular or neurological and the most common pattern is the one system affection. This will help to predict the system that will be affected in each time the patient presents with a disease relapse. Also, it will help in differentiation between disease relapse and any associated other disease, minimizing the need for and the cost of investigations. We believe that this manuscript is appropriate for publication by The Egyptian Rheumatologist Journal. This manuscript has not been published and is not under consideration for publication elsewhere. We have no conflicts of interest to disclose and all authors have approved the manuscript and agree with its submission. The ethics committee has approved the submission.

Thank you for your consideration.

Sincerely,

Dr Marwa Abdo (Corresponding author):

2  
3 **Introduction:**  
4  
5

6 Behcet's disease (BD) is a relapsing multisystem inflammatory disease [1]. Recurrent oral  
7 ulcers are the most common clinical manifestations in BD, present in almost all patients,  
8 followed in descending order by genital ulcers, erythema nodosum and papulopustular  
9 lesions followed by arthritis, uveitis, thrombophlebitis, gastrointestinal and central nervous  
10 system involvement [2]. Most BD patients initially manifest with recurrent oral ulcers with a  
11 frequency of 97-100% [3] while genital ulcers vary from 62-100% of patients.  
12 Pseudofolliculitis, papulopustular eruption, and erythema nodosum are the most common  
13 skin manifestations of BD [4].  
14  
15  
16  
17  
18  
19  
20  
21

22 In BD, renal involvement is not infrequent being mild in most cases [5]. Cardiovascular  
23 involvement occurs in 7-46% in the form of pericarditis, myocarditis, endocarditis, valve  
24 diseases, endomyocardial fibrosis, and intracardiac thrombosis. [6]. Pulmonary  
25 manifestations are reported in 0.3-18% of BD cases [7] and the patterns are quite  
26 heterogeneous and include pleural effusion, pulmonary arteritis or venulitis, emphysema,  
27 pneumonia, chronic bronchitis, and fibrosis. Pulmonary artery aneurysm is characteristic of  
28 BD and carries a poor prognostic sign [8].  
29  
30  
31  
32  
33  
34  
35  
36

37 Vasculitis in BD may involve the small, medium and large vessels and can affect both the  
38 arterial and venous sides of the circulation [9]. Vascular involvement is seen in 15–38% of  
39 BD patients [10]. Prevalence of arterial involvement is 1.5–3% worldwide [11], with an  
40 outlier report from Saudi Arabia in 18% of cases [12]. Arterial involvement is mainly in the  
41 form of aneurysms and occlusions [12]. Arterial aneurysm frequently occurs in the  
42 abdominal aorta [13] however, any artery can be involved and the most common  
43 complication is rupture, a main cause of mortality [14]. Venous lesions are the most frequent  
44 vascular lesions and include deep venous thrombosis (DVT) and large veins thrombosis  
45 (superior and inferior vena cava, mesenteric, portal, hepatic, splenic, iliac, subclavian vein  
46 and dural sinus thrombosis) [4].  
47  
48  
49  
50  
51  
52  
53  
54  
55  
56

57 Ocular manifestations occur within 2–4 years of BD onset [15] in about 70% of patients [16].  
58 Uveitis is the commonest form of ocular involvement and the initial ocular inflammation  
59 usually starts anterior and unilateral. Later, inflammation usually affects the posterior  
60 segment and becomes bilateral, a vision threatening manifestation [15].  
61  
62  
63  
64  
65

1  
2 Neurological involvement occurs in 5–30% of BD patients [17] and is the initial presentation  
3 of the disease in about 5-23% of patients (neuro-Behçet’s disease; NBD) [18]. NBD is  
4 divided into parenchymal (more common) and non-parenchymal manifestations [19]. The  
5 most frequent neurological manifestations are recurrent meningoencephalitis, cerebral  
6 venous thrombosis, cranial nerve palsies and epilepsy [17].  
7  
8  
9  
10

11  
12  
13 Many studies analyzed clinical characteristics of BD but did not focus on the course of the  
14 disease and whether relapse will be involving the same system affected as at the first disease  
15 relapse or not. The aim of the present study was to assess this point through studying the  
16 frequencies of different disease manifestations, patterns and disease subsets.  
17  
18  
19  
20

### 21 **Patients and methods:**

22  
23  
24  
25  
26 The medical records of 82 BD patients, who were admitted and followed up in the  
27 Rheumatology Department of Cairo University Hospitals from January 2000 to December  
28 2014, were retrospectively reviewed to analyze disease patterns and subsets. Diagnosis of BD  
29 was made according to the criteria of the International Study Group for Behçet’s disease  
30 [20]. The study was approved by the local ethics committee of Cairo University scientific  
31 review board, and informed consent was obtained from all subjects according to the 2008  
32 Declaration of Helsinki.  
33  
34  
35  
36  
37  
38  
39

40  
41 Collected data included age, gender, age at onset and first admission, and disease duration.  
42 The main 4 clinical presentations (disease subsets) of BD (mucocutaneous, neurological,  
43 ocular or vascular) were considered. Laboratory investigations performed included complete  
44 blood picture, erythrocyte sedimentation rate (ESR), liver and kidney function tests. The  
45 number and causes of admissions were recorded; causes of first and repeated admissions  
46 were assessed. Systems patterns at disease onset and during follow up were analyzed.  
47 Radiological investigations to confirm the diagnosis e.g. Doppler, MRI brain, slit lamp and  
48 fundus examination were considered. Medications received were also reported.  
49  
50  
51  
52  
53  
54  
55  
56

57 *Statistical Analysis:* An IBM compatible PC was used to store and analyze the data and to  
58 produce graphic presentation of important results. Calculations were done by means of  
59 statistically software package namely “SPSS 13” for Windows (SPSS, Chicago, IL, USA).  
60 Results were expressed as mean  $\pm$  S.D. Chi-square test was used for qualitative data. Values  
61 were considered statistically significant if p-value is  $<0.05$ .  
62  
63  
64  
65

1  
2  
3 **Results:**  
4  
5

6 Demographic data and laboratory investigations of the patients are shown in table 1 and  
7 clinical manifestations in table 2. Frequencies of initial clinical manifestations and causes of  
8 first admission are shown in table 3. Number of admissions of BD patients ranged from 1 to  
9 7 ( $3.02\pm 1.7$ ). The frequency of different causes of admissions is shown in table 4. Disease  
10 patterns were observed and the results showed that the majority of patients developed single  
11 system pattern from the initial till the last flare (table 5).  
12  
13  
14  
15  
16  
17

18 Almost all patients (n=80) were on steroids at a mean dose of  $22.3\pm 12.7$  mg/day. The  
19 following medications were received by the patients; cyclophosphamide (n=50; 61%),  
20 azathioprine (n=44; 53.7%), cyclosporine A (n=14; 17.1%), colchicine (n=12; 14.6%),  
21 biologic therapy (n=9 on infliximab and 1 on adalimumab; 12.2%), methotrexate (n=4;  
22 4.9%) and both sulfasalazine and mycophenolate mofetil by 1 patient each. Oral  
23 anticoagulants were received by 27 (32.9%). The number of patterns were comparable  
24 between those receiving and those not the different medications ( $p>0.05$ ) and between  
25 smokers and non-smokers ( $p=0.67$ ). There was a tendency to an increased number of system  
26 patterns in females compared to males ( $p=0.22$ ). The study included 2 juvenile-onset BD  
27 cases, one of them had one system pattern which was ocular and the other had 3 systems  
28 pattern (ocular, vascular and neurological).  
29

35  
36  
37  
38  
39

40 **Discussion:**  
41  
42  
43

44 Literature focusing on the course of BD and whether the same system is repeatedly involved  
45 is scarce. In this study, disease patterns and subsets of BD patients were analyzed and the  
46 cause of repeated admissions determined. The current male to female ratio was 10.7:1.  
47 Gender distribution in BD patients differs widely depending on their ethnic origin and  
48 country of residence [21]. The frequency of male patients diversly ranged from 27% in USA  
49 to 87% in Azerbaijan [22]. A higher frequency of male patients in North African and  
50 subSaharan patients was found in comparison to those from Europe. High male to female  
51 ratio in developing countries may be due to under diagnosis of BD in females due to  
52 reluctance of females to seek medical advice for genital ulcers [21].  
53  
54  
55  
56  
57  
58  
59  
60  
61  
62  
63  
64  
65

1  
2 The 4 main clinical subsets detected included mucocutaneous (100%), ocular (64.6%),  
3 vascular (59.8%) and neurological (11%). In this study, mucocutaneous manifestations  
4 represented 75.9% of first presentation of the disease. In agreement, the overall frequency of  
5 oral ulcers ranges between 95 and 100% of the BD patients [4]. A similar study reported that  
6 oral lesions are the first manifestation perceived in 25 to 75% of cases [23]. Egyptian studies  
7 also reported similar results with oral ulcers in 100% of BD patients [24-26], 84.2% [27],  
8 80% [28]. Different results were reported by another Egyptian study with oral ulcers in 50%  
9 [29].

10  
11  
12  
13  
14  
15  
16  
17  
18  
19 Genital ulcers were present in 96.3% of patients. In harmony, genital ulcers are the second  
20 most common manifestation present in a large percentage of BD patients [23] and have been  
21 reported in different frequencies from 62-100% of patients [22]. Egyptian studies also  
22 reported similar results with genital ulcers in 96.8% [26], 95.5% [24], 85% [25], 78.2%  
23 [27], 76% [28].

24  
25  
26  
27  
28  
29  
30 Erythema nodosum was observed in 23.2% of the patients. Similar results were reported in  
31 23% [30], while others found erythema nodosum in 51% of patients [31].

32  
33  
34  
35 In the present study, ocular involvement occurred in 64.6% of patients. This was in  
36 agreement with another study which reported that eye involvement occurs in 30–70% of BD  
37 patients [32]. Egyptian studies showed that ocular involvement was seen in 73.7% [27],  
38 38.9% [29], 63.6% [24], 47.6% [26]. Ocular manifestations occurred as initial presentation in  
39 29% of BD patients and this was in agreement with another study [33].

40  
41  
42  
43  
44  
45  
46 Vascular involvement was observed in 58.9% of patients and represented 16.8% of first  
47 disease presentation. This was higher than that reported in other Arab countries. In Saudi  
48 Arabia it was 40% [34]. In Asian populations, vascular BD was less common than in Arabs;  
49 in Singapore it was 5.4% [35], in Hong Kong 11% [36] and in Korea 1.8% [37]. While in  
50 Turkey, Japan and Europe, the frequencies of vascular involvement were 17%, 9% and 10-  
51 37% respectively [7]. An Egyptian study reported vascular lesions in 57.1% [26].

52  
53  
54  
55  
56  
57  
58  
59 Neurological (parenchymal) involvement was observed in 11% of patients and represented  
60 1.2% of first disease presentation. Similar results were found in Japan (11%), Germany  
61 (11%), Tunisia (12%) and US (13%) [38]. A slightly higher percentage of neurological  
62 involvement was reported in Egyptian BD patients (34.9%) [26], 30% [25] and 26,3% [27].  
63  
64  
65

1  
2 Regarding causes of admissions, ocular disease was the commonest and represented 41.4%,  
3 followed by vascular (18.9%), neurological (7.2%) and mucocutaneous (3.7%). In the  
4 current work, 58.5% of patients had one system pattern involvement while 30.5% had two  
5 system patterns and 11% had three system patterns involved throughout disease course. In  
6 patients with one system pattern affection, the most frequently affected was ocular followed  
7 by vascular then mucocutaneous. There was no isolated neurological affection. The most  
8 frequent combination was between ocular and vascular manifestations followed by vascular  
9 and neurological then ocular and neurological.  
10  
11  
12  
13  
14  
15  
16  
17  
18

19 In conclusion, this study suggests that BD usually affects the same system throughout the  
20 disease course whether mucocutaneous, vascular, ocular or neurological and the most  
21 common pattern is the one system affection. This will help to predict the system that will be  
22 affected in each time the patient presents with a disease relapse. Also, it will help in  
23 differentiation between disease relapse and any associated other disease, minimizing the need  
24 for and the cost of investigations. However, future studies on larger number of patients are  
25 recommended.  
26

**Table 1:** Demographic data and laboratory investigations of the Egyptian Behçet's disease patients

Demographic data in BD patients (n=82)	
Age (years)	34.2±9.7 (18-57)
Sex (M:F)	75:7 (10.7:1).
Smokers	30 (36.6)
Age at onset (years)	28.5±6.7 (11-47)
Age at first admission (years)	32.1±8.7 (17-53)
Disease duration (years)	9.1±7 (1-34)
Hemoglobin (g/dl)	13.2±1.5
Platelets (x10 <sup>3</sup> /mm <sup>3</sup> )	263.3±81.5
TLC (x10 <sup>3</sup> /mm <sup>3</sup> )	8.5±2.5
ESR (mm/1 <sup>st</sup> hr)	27.2±21.1
AST (U/L)	27.1±15.9
ALT (U/L)	33.5±23.6
Creatinine (mg/dl)	0.83±0.17
Urea (mg/dl)	15.4±6.3

BD: Behçet's disease, TLC: Total leucocytic count, ESR: erythrocyte sedimentation rate, AST: aspartate tranaminase, ALT: alanine transaminase. **Values presented as mean±SD (range) or n(%).**

**Table 2:** Different clinical subsets of the Egyptian Behçet's disease patients

Clinical Manifestations n (%)	BD patients (n=82)	
<b>Mucocutaneous</b>	<b>82</b>	<b>(100)</b>
Oral Ulcers	82	(100)
Genital Ulcers	79	(96.3)
Erythema nodosum	19	(23.2)
Acne	12	(14.6)
Folliculitis	4	(4.9)
Papular rash	2	(2.4)
Others ( <i>pustules, vasculitis, furuncles</i> )	3	(3.7)
<b>Ocular</b>	<b>53</b>	<b>(64.6)</b>
Anterior uveitis	24	(29.3)
Posterior uveitis	25	(30.5)
Panuveitis	9	(10.9)
Retinal vasculitis	16	(19.5)
Vitritis	25	(30.5)
Retinal vein occlusion	8	(9.8)
Retinal artery occlusion	7	(8.5)
<b>Vascular</b>	<b>49</b>	<b>(59.8)</b>
DVT	27	(33)
Pulmonary embolism	9	(11)
Aneurysm	8	(9.8)
Stroke	7	(8.5)
Sigmoid sinus thrombosis	2	(2.4)
Transverse sinus thrombosis	2	(2.4)
Superior sagittal sinus thrombosis	1	(1.2)
Brain vasculitis	6	(7.3)
Retinal vein occlusion	8	(9.8)
Retinal artery occlusion	7	(8.5)
<b>Neurological (parenchymal)</b>	<b>9</b>	<b>(11)</b>
Cranial nerve palsy	5	(6)
Brain encephalitic changes	1	(1.2)
Brain demyelinating foci	1	(1.2)
Focal encephalomalacia	1	(1.2)
Periventricular leukoencephalopathy	1	(1.2)

BD: Behçet's disease, DVT: deep venous thrombosis.

**Table 3:** Clinical manifestations (subsets) of the Egyptian Behçet's disease patients at disease onset and at first admission

Manifestations n (%)	BD patients (n=82)	
	At onset	At 1 <sup>st</sup> admission
Mucocutaneous	62 (75.9)	2 (2.4)
Ocular	23 (28.9)	40 (48.2)
Vascular	13 (16.8)	37 (45.8)
Neurological(parenchymal)	1 (1.2)	4 (4.8)

BD: Behçet's disease

**Table 4:** Clinical presentation causing admissions of the Egyptian Behçet's disease patients

Presentation n (%)	BD patients (n=82)
Mucocutaneous	9 (3.6)
Ocular	103 (41.4)
Vascular	47 (18.9)
Neurological (parenchymal)	18 (7.2)
Others (infection or bleeding)	72 (29)
Total admissions	249 (100)

**Table 5:** Distribution of systems pattern affection in Egyptian Behçet's disease patients

	System pattern n (%)	BD patients (n=82)
<b>One</b>	Ocular	28 (34.1)
	Vascular	16 (19.5)
	Neurological	0 (0)
	Mucocutaneous	4 (4.9)
<b>Two</b>	Ocular + vascular	15 (18.3)
	Vascular + neurological	9 (11)
	Ocular + neurological	1 (1.2)
<b>Three</b>	3 systems involved	9 (11)

BD: Behçet's disease
