

The critical care management issues of organ transplant recipients are a growing area to which intensivists are increasingly being exposed. The postoperative care and Intensive care for recipient of organ transplant and this period of time in the patient's life is crucial, very serious, and require multidisciplinary team work with complete coordination, specified duties for all the team members and performance of timed planned activities to determine post-operative complications, evaluate the healing process, and tolerance of immunosuppressive drugs, to establish the functionality of the transplanted organ and the continuous evaluation of the effects of immunotherapy. Coordination and sharing of patient management information and taking team decision regarding patient management require collaborative care between the Transplant team. Clinical pathway are multidisciplinary timed care plans, emphasizing evidence based interventions and reducing variations in care lead to high quality, less costly care.
